

1.15 1.133 gives us:

$$\sum_{i_1=1}^D \sum_{i_2=1}^D \cdots \sum_{i_M=1}^D w_{i_1 i_2 \dots i_M} x_{i_1} x_{i_2} \cdots x_{i_M}$$

In this expression, the interchange symmetries can be seen when, for example, for some  $1 \leq k < l \leq M$ ,  $i_1 = k$  and  $i_2 = l$ , and  $i_1 = l$  and  $i_2 = k$  give us the same result.

But in 1.134:

$$\sum_{i_1=1}^D \sum_{i_2=1}^{i_1} \cdots \sum_{i_M=1}^{i_{M-1}} w_{i_1 i_2 \dots i_M} x_{i_1} x_{i_2} \cdots x_{i_M}$$

we can see that  $i_1 \geq i_2 \geq \dots \geq i_{M-1}$ . So, for  $1 \leq k < l \leq M$ ,  $i_1 = l$  and  $i_2 = k$  is possible but  $i_1 = k$  and  $i_2 = l$  is not. So the symmetries disappear.

To find the number of independent parameters, we can see that for a fixed  $i_1$ , the number of independent parameters is  $n(i_1, M-1)$ . The  $(M-1)$  is there because the fixed  $i_1$  makes first summation irrelevant.

Therefore, the total number of independent parameters becomes:

$$n(D, M) = \sum_{i=1}^D n(i, M-1)$$

Now to prove 1.136 by induction. First we prove the result for  $D = 1$  and arbitrary  $M$ :

$$\begin{aligned} L.H.S &= \sum_{i=1}^D \frac{(i+M-2)!}{(i-1)!(M-1)!} \\ &= \sum_{i=1}^1 \frac{(i+M-2)!}{(i-1)!(M-1)!} \end{aligned}$$

$$\begin{aligned}
&= \frac{(1+M-2)!}{(1-1)!(M-1)!} \\
&= \frac{(M-1)!}{0!(M-1)!} \\
&= 1
\end{aligned}$$

$$\begin{aligned}
R.H.S &= \frac{(D+M-1)!}{(D-1)!M!} \\
&= \frac{(1+M-1)!}{(1-1)!M!} \\
&= \frac{M!}{0!M!} \\
&= 1
\end{aligned}$$

$L.H.S = R.H.S$ , thus proved for  $D = 1$ .

Assuming it is correct for dimension  $D$  and verifying that it is correct for dimension  $D + 1$ :

$$\begin{aligned}
L.H.S &= \sum_{i=1}^{D+1} \frac{(i+M-2)!}{(i-1)!(M-1)!} \\
&= \left( \sum_{i=1}^D \frac{(i+M-2)!}{(i-1)!(M-1)!} \right) + \frac{((D+1)+M-2)!}{((D+1)-1)!(M-1)!} \\
&= \frac{(D+M-1)!}{(D-1)!M!} + \frac{(D+M-1)!}{D!(M-1)!}
\end{aligned}$$

$$\begin{aligned}
R.H.S &= \frac{((D+1)+M-1)!}{((D+1)-1)!M!} \\
&= \frac{((D+1)+M-1)(D+M-1)!}{((D+1)-1)(D-1)!M!}
\end{aligned}$$

$$\begin{aligned}
&= \left( \frac{((D+1) + M - 1)}{((D+1) - 1)} \right) \left( \frac{(D+M-1)!}{(D-1)!M!} \right) \\
&= \left( \frac{(D+M)}{D} \right) \left( \frac{(D+M-1)!}{(D-1)!M!} \right) \\
&= \left( 1 + \frac{M}{D} \right) \left( \frac{(D+M-1)!}{(D-1)!M!} \right) \\
&= \frac{(D+M-1)!}{(D-1)!M!} + \frac{M}{D} \frac{(D+M-1)!}{(D-1)!M!} \\
&= \frac{(D+M-1)!}{(D-1)!M!} + \frac{(D+M-1)!}{D!(M-1)!}
\end{aligned}$$

Since L.H.S = R.H.S, 1.136 is verified.

Now to prove 1.137 by induction. First we prove it for  $M = 2$ .

Using 1.135 to simplify the L.H.S of 1.137:

$$n(D, 2) = \sum_{i=1}^D n(i, 1) = \sum_{i=1}^D i = \frac{D(D+1)}{2}$$

Simplifying the R.H.S of 1.137:

$$\begin{aligned}
\frac{(D+M-1)!}{(D-1)!M!} &= \frac{(D+2-1)!}{(D-1)!2!} \\
&= \frac{(D+1)!}{(D-1)!2!} \\
&= \frac{(D+1)D}{2}
\end{aligned}$$

Thus, the result is true for  $M = 2$ .

Assuming the result holds for  $M-1$ , we check if it holds for  $M$ :

$$\begin{aligned}
L.H.S &= n(D, M) \\
&= \sum_{i=1}^D n(i, M-1) \\
&= n(D, M-1) + \sum_{i=1}^{D-1} n(i, M-1) \\
&= n(D, M-1) + n(D-1, M) \\
\\
R.H.S &= \frac{(D+M-1)!}{(D-1)!M!} \\
&= \frac{(D+(M-1)+1-1)!}{(D-1)!(M-1)!M} \\
&= \frac{(D+M-1)(D+(M-1)-1)!}{M(D-1)!(M-1)!} \\
&= \left( \frac{(D+M-1)}{M} \right) \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) \\
&= \left( \frac{(D-1)}{M} + 1 \right) \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) \\
&= \left( \frac{(D-1)}{M} \right) \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) + \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) \\
&= \left( \frac{(D-1)}{M} \right) \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) + n(D, M-1) \\
\\
&= \left( \frac{(D-1)}{M} \right) \left( \frac{(D+(M-1)-1)!}{(D-1)!(M-1)!} \right) \\
&= \left( \frac{(D+(M-1)-1)!}{(D-2)!M!} \right) \\
&= \left( \frac{((D-1)+M-1)!}{((D-1)-1)!M!} \right)
\end{aligned}$$

$$= n(D-1, M)$$

$$\implies R.H.S = n(D, M-1) + n(D-1, M) = L.H.S$$

Thus proved 1.137.
